ALFA allergen mixtures are designed as screening tests. This means the respective allergen solution is optimized to detect as many allergic persons as possible. For this purpose so called „lead allergens“ were combined in the respective ALFA Screens. ALFA Seasonal Inhalation Screen for example utilizes g6 (Timothy Grass), t3 (Birch), w6 (Mugwort) und m6 (Alternaria alternata). g6 covers more than 96% of all persons allergic to grass pollen (1), t3 is highly cross-reactive to t2 and t4, w6 is partially cross-reactive to w1, m6 is the most significant seasonal mold. This approach was applied to all allergen mixtures.
